For Immediate Release

Popular MPEG export for QuickTime now available on PC

CUPERTINO, Calif. – 14 March 2007 – PixelTools Corporation Inc. announced today the first shipments of HDProQT version 4.58 for PC and Mac. This update now provides PC video compressionists with the same popular ultra high quality HD encoding that has been available exclusively on the Mac for the past two years.

HDProQT is a QuickTime plug-in component that provides HD MPEG Transport and Program stream export from any video software package that recognizes QuickTime plug-in components. Export format is ideal for HD display, Blu-Ray, HD-DVD and Video on Demand systems. “The integration of video encoding, audio encoding, and transport multiplexing into a single step export from the Video Timeline greatly enhances the video production work-flow of creating studio quality encoding” commented Mark Conover, PixelTools, Chief Technical Officer. HDProQT adds HD MPEG export to Adobe After Effects, QuickTime Player Pro version and Final Cut Pro (Mac only).

Details of the product and a working demo are available from the [PixelTools](http://www.pixeltools.com) web site.

PixelTools produces and publishes a broad line of MPEG software utilities along with the best selling MpegRepairHD, a MPEG utility that encodes, decodes, analyzes and edits MPEG streams. Professional video compressionists have found MpegRepairHD to be an essential tool in a wide variety of uses ranging from real-time high definition MPEG encoding to the insertion of closed captioning headers into existing streams. Along with ultra high quality encoding, MpegRepairHD will also mux and de-mux MPEG program and transport streams video and MPEG, A/C-3, DTS, and AAC audio.
